Subject: August Maxi Course Session - Question??

Hi Doctor Niznick:

Thank you for your suggestions regarding implants best suited for orthodontic cases. I will talk with Yvonne about a starter inventory and the implant drill systems next week. My two sons are recent grads that will be joining me in practice. We plan to provide all specialty phases of dentistry including implant dentistry. Our new website.... www.dentalspecialists.com is under development and we plan to add more content related to implant dentistry. Would you give us permission to use one or more of your implant videos?

In addition, we have recently uploaded version 1 of a new iPhone App.... iBracesHelp.com.....I noticed you responded to my last email via your iPhone. It's a free download....check it out at the following link.....
<http://itunes.apple.com/us/app/ibraceshelp/id381328159?mt=8>

Version 2 should be uploaded this week. I plan to add a section that will cover the use of TADS and Implants in orthodontics. Hopefully, we can include some of your videos.

I am still a virgin "implant dentist" and probably know just enough to be dangerous....so please help me with my questions below:

Why would a 2.4 - <3.0 mm mini compromise an implant site? I have a colleague that has been using 2.0 and 2.4 one piece implants for more than 7 yrs with great success (97%). Not all implant site preparation by the orthodontist will allow one to safely use an implant greater than 3.0. Also the anterior posterior bone width may require a bone graft even though the mesial distal width may be adequate. This adds additional cost and other complications to the procedure at a young age. Wolf's law favors having something in place during the waiting period to maintain the finished level of bone (right after ortho) in the implant site. Would the mini maintain the vertical bone height during the waiting period?

I also have finished many cases at age 15 or 16 which may not allow for insertion of an implant until 2 to 3 years later. **When the child reaches the "maturity age" and the dentist is ready to place the implant(s) the teeth have relapsed.** **The patient returns to the orthodontist with the attitude (either patient's attitude or**

spurred on by the general dentist) that the case was not properly prepared. I have retreated many cases at no charge or have refunded their monies. This is one of the main reasons I am obtaining the knowledge at the MAXI Course.

My thought for these cases would be to provide a TAD supported provisional crown or place a mini implant as a "provisional implant". I realize that the implant will probably osteointegrate and may remain stable enough to leave it in place until it fails. Only when it fails the operator would replace the mini with a larger implant. At that time bone grafting and implant site enhancement could be done prior to placing a larger fixture. If additional orthodontics is required, I would have less remorse regarding charging the patient for additional procedures. We would also inform the patient upfront that these situations may require multiple procedures and added costs.

My take home from your previous comments is to use an implant 3.0 to 3.7 mm or > whenever possible. Do you have any other thoughts regarding the one to three year waiting period just after completion of orthodontics?

Thank you very much for taking the time to communicate with me!

Paul

I would suggest Legacy3 13mm implants for the laterals | 3.2mm and 3.7mm diameters. For the bicuspids you may also use the 3.7mm and 4.2mm diameters in 11.5 and 13mm lengths. I would not compromise the surgical sites with minis. Here are 3.2mmD 13mmL

Hi Yvonne....thank you for the update. I look forward to seeing you again next week.

As an orthodontist that may limit his implant insertions to only teeth numbers 7, 10 and missing 2nd bicuspid what inventory would you and Doctor Niznick suggest I have on hand. I am considering using Imtek minis (2.4mm) for provisional/permanent fixtures, but will try to prepare spaces orthodontically to accept a 3.0 or 3.5s'.

I am also looking for the most economical implant electric drill set for doing the implant insertions. What do you suggest for an orthodontist/implant dentist? Do you have a bundle offering?

I plan to fully document all my future cases and publish results to my peers. We may start a trend in orthodontic practices to orthodontically set up implant sites and also do the insertions ourselves. In this economy, I am sure I will create interest in this concept with my colleagues. I wanted to be trained and qualified prior to publishing my thoughts. I will also suggest that my orthodontic colleagues take an implant training course or residency such as Dr. Mill's Maxi Course.

Any help that you and Implant Direct can give me will be truly appreciated.

Thank you for your help!

Paul

Subject: August Maxi Course Session

Dear All:

I want to let everyone know that I will be attending the upcoming Maxi Course session. I will be available to go over our implant systems, surgical tray and restorative options. Dr. Niznick has extended a special offer to the Maxi Course participants which I will go over at the course. I also have the details on what implant sizes Dr. Mills recommends that you keep in inventory. I look forward to seeing everyone Thursday!

Warm regards,

Yvonne Goldman
